8. Not known exactly; my inbox; [400; 800]
9. Solving $\frac{421+b}{421} \frac{b-1}{b} < 1$ gives $b < \frac{1+\sqrt{1685}}{2}$, so $b < 20.99$. Therefore he should sell when $b = 20$, or $k = 345$.
10. $45 - 6 = 39$
11. player 1 loses
12. 8/7 Let $2y = x$, so we are trying to find the max of

$$\frac{2^n y^n}{1 + y + \dots y^{2n}}$$

By the AM-GM inequality, we know

$$y^n = \sqrt[2n+1]{1 * y * y^2 * \dots * y^{2n}} \leq \frac{1 + y + \dots y^{2n}}{2n + 1}$$

with equality iff $1 = y = \dots = y^{2n} = 1$. Thus the function maximizes at $y = 1$, giving $\frac{2^n}{2n+1}$.

13. 2/3 Telescoping, we see that

$$a_n = a_1 - \frac{z}{1} + \frac{z}{2} + \frac{z}{n} - \frac{z}{n+1}$$

Therefore, $a_n = \frac{z(n+1) - zn}{n(n+1)} = \frac{z}{n(n+1)}$ so $a_y = \frac{z}{y(y+1)}$.
